Going into the meeting we had completed most of the front end for our project. We had a login page, meet the developers, and a home page. The last thing we need to consider for this is the master dungeon screen, where they can view the other players in their game and their stats.

The things that do work on the website is when you click the "Log Out" button, it takes you back to the sign in page, and when you click "Meet the Team", it take you to the meet the team page.

The database is currently being worked on. We are deciding what tables need to be used and what their attributes should be.

Some issues faced are knowing what to implement on the dungeons and dragons player sheet just because not all of us play D&D, but we thought this would be a very good idea as a project and would give us some experience.

Some of the guidance given to us by the ta :

Look into firebase for easier nodes

Work on middle layer

UI - HOME, LOGIN, MEET the Players

Home and login will be dynamic, they need to show information provided by database or the server,

Login page should start displaying "now logged in as" if successful login

Next important steps, setting up database and server and getting connection going

Start working on login more

We need to start working on our database and our server and how they are going to interact with each other. We need to get a working login so that we can start building other parts of our project.
